MARTIN'S

EQUATION TABLES:

DESIGNED TO FURNISH

MERCHANTS,

MANUFACTURERS AND OTHER BUSINESS MEN,

WITH AN

ACCURATE SET OF CALCULATIONS

FOR

AVERAGING ACCOUNTS,

AND ENABLING THE

BOOK-KEEPER

TO PERFORM, WITH GREAT FACILITY AND DESPATCH, WHAT HAS HITHERTO BEEN A TEDIOUS PROCESS IN THE

SCIENCE OF EQUATIONS.

PREFACE.

The author of the following Tables, was for a number of years connected with an extensive manufacturing establishment, where sales were made mostly on time. He was consequently often called upon to *average accounts*, as most of the customers preferred paying several small purchases at one time, or settling their running accounts by giving their notes.

Having six or eight hundred accounts upon the Ledger, each of which at short periods required to be averaged, he found that it took up a large portion of his time in working equations, and the idea occurred to him that possibly some shorter method of averaging accounts than the one usually practiced, might be discovered, or that a set of Tables could be constructed which would greatly facilitate the process.

After trying various experiments, with reference to the subject, he has at length produced the following tables, arranged in such a manner as to enable any person to work an equation, even though he has had no previous knowledge of any kind upon the subject.

There are thousands of business men in the commercial world, who are entirely ignorant of any process whereby to average an account, and there are other thousands who understand the subject but imperfectly and who very often merely *guess* at an average date, which they think is not very far from the exact point to be reached.

Again, there are many who do not have *very frequent* occasion to average an account and doing it but seldom, forget the exact method, and are compelled to look up and study the "rule" for doing it, on every recurrance of the occasion, and after all, the process is very tedious where an account has been running some time — requiring a great number of figures, and considerable mental effort in "computing time," multiplying the time into dollars, &c., &c.

Now by the use of these tables, all this labor is done for him. The Book-keeper is not obliged to count the time intervening between bills of different dates, and then multiplying these numbers by the different amounts — he has merely to open his Ledger, and then turning from page to page of this book, find each date of his account, and opposite the number of dollars, find the sum already worked for him. This you observe is a very great saving of both time and labor; and not only so, but simplifies the matter very materially, enabling every business man to average his own accounts, without being dependant upon others to do it, and making an easy process of what was before a task.

Another advantage which might result from the use of this work, is that merchants would be more apt to examine accounts sent them for settlement, to ascertain whether or no the average as made by the person sending it is correct. In this manner it might be the means of saving a considerable amount of interest in the course of the year.

The principle upon which these tables are constructed, is the "multiplication of days into dollars."

Taking the first day of January as a starting point, each day of the year counted from the first of January is multiplied into each amount, from one dollar to one hundred, and from one hundred to two thousand.

Merchants and Book-keepers, who may use this work, can rely upon the *perfect correctness* of every combination of figures in these tables, as the author has himself gone through with it *three times*, and also employed another person to examine it from beginning to end, computing each amount separately.

The tables can be used in Canada, where pounds, shillings and pence compose the currency, by calling the pounds dollars, and whenever the shillings exceed ten, to add one to the pounds or dollars; thus: £4 6s., called $4, £4 15s., called $5.

EQUATION OF PAYMENTS.

Equation of Payments is the finding a *medium* or *average* time, for the payment of several sums due at different times, so that neither the debtor nor creditor shall lose or gain interest.

ILLUSTRATION.

Suppose I purchase on the first of January a bill of goods, amounting to $300 at 3 months credit.
" " " " " 300 " 4 " "
" " " " " 300 " 5 " "

Now any person of ordinary attainments in figures, could *guess* correctly at the average or medium time, at which the whole could be paid, without loss to either party, viz. 4 months; for the reason that the three bills are each of the same amount, and the bill at 4 months is equally removed from the first at 3 months and the last at 5 months. This is a clear case, and would not require a very expert accountant to decide.

The generality of mercantile accounts, however, are not of the above simple character, but are made up of bills of *various* amounts, at *various* dates, and often on *various* terms of credit, and consequently the proportion that they would bear to each other would be different in every instance. It is therefore evident that some other process than "guessing" is necessary to determine nine hundred and ninety-nine out of every thousand cases.

There are two principal methods now in use by accountants in equating payments, viz.: after arranging the bills in the order in which they become due, compute the time intervening between the first bill and each succeeding one, and finding the interest upon each bill for the time it has run. Sum up the several items of interest thus obtained, and then find how long it would take the whole amount of the debt to accumulate that amount of interest which would be the equated time.

The other method is to compute the time intervening between the date when the first amount becomes due, and each succeeding one,—then multiply the numbers so found into their respective amounts and divide the sum of the several products by the whole debt. Now, either of the above methods involves a great deal of time and labor, and the use of a great many figures. The following tables have been constructed upon the principle of the last named process, so arranged as to do away with three-fourths of the labor heretofore required. By the use of these tables, the Book-Keeper will not be obliged to count the time intervening between different dates, nor need he multiply the different amounts by the *time* thus found, as it is already multiplied in these tables. *All that it will be necessary for him to do in a simple Equation, will be to turn to the different dates of his bills, as found at the top of the figure columns of this book, and opposite each amount, from one dollar to two thousand dollars, he finds a sum of figures which he sets down, and when he has gone through with his account, divides the sum of these several amounts by the whole debt. The answer thus found, on referring to the Table of Quotients, will point to the average date.*

Besides the three tables of Quotients in the first part of this book, there are 72 pages of tables arranged with reference to dates continuously, from Jan. 1st to Dec. 31st. There is a column of figures for each day of the year, and each page has ten dates, the right hand page being a continuation of the left, and having the same dates. Upon the margin are printed words and figures as follows: Jan. 10, 20, 31 — Feb. 10, 20, 29, and so on through the months of the year. These refer to the ten dates upon each page, and were orginally intended to be cut to form an index of dates, but it was found that it would materially injure the appearance of the book, and was therefore left uncut. The dates are easily found at the top by turning from page to page.

There is also a column of figures on the extreme right of each page, marked 2d year, which is to be used when the account embraces parts of two years, as will be explained hereafter.

SIMPLE EQUATION.

By the term Simple Equation, is meant the averaging of *one side* of an account only, either the debtor or creditor. I will now give you one example to illustrate the manner of using these tables, and then give rules for averaging the different varieties of accounts.

EXAMPLE.

I turn to an account upon my Ledger, against a merchant, who has purchased goods of me at different times, on a credit of 6 months, viz.:

January	15,	bill goods, - - - - - - -	$40 00
"	19,	" - - - - - - - -	75 00
April	16,	" - - - - - - -	100 00
June	10,	" - - - - - - -	15 00
		Total, - - -	$230 00

The mode of determining the average date of this account, will be as follows:

Open the book at January 20.
On the *left* hand page opposite $40 and under January 15th, you find - - - 560 .
On the *right* hand page opposite $75 and under January 19th, you find - - - 1350
Open the book at April 20,
On *either* page opposite $100 and under April 16th, you find - - - - - 10500
Open the book at June 10,
On the *left* hand page opposite $15 and under June 10th, you find - - - - 2400

Add these several amounts and divide by the whole debt - - - - 230) 14810 ($64\frac{90}{230}$ Ans.

Now turn to Table of Quotients No. 1, and opposite the number 64 you find March 6th, which is the *average purchase* of all the bills, and as they were sold on a credit of 6 months, the whole account will be *due* 6 months from March 6th; or if they were bought on a credit of 4 months, the whole account would be due 4 months from March 6th. The quotient 64 and $\frac{90}{230}$ths signifies that the account *averages* 64 and $\frac{90}{230}$ths days from January 1st. The fraction $\frac{90}{230}$ is not taken into account, as it is less than one half of the divisor. Should it in any case exceed one half, we call it one. I will give another example which perhaps will make the matter clearer:

Suppose a bill of goods sold January 2d, amounting to $25
" " " 4th, " 25
" " " 6th, " 25
— $75

That account would evidently *average* January 4th, as the bill sold on the 4th is equally removed from that sold on the 2d, and the one sold on the 6th, the amounts being the same.

Now turn to January 2d, and opposite $25 you find 25
" " 4th, " 25 " " 75
" " 6th, " 25 " " 125

Add them and divide by the whole debt, - - 75) 225 (3 Ans.

Turn to Table of Quotients No. 1, and opposite number 3 is January 4th. The principle is the same whatever the amounts are, or however scattering the dates may be.

NOTE.—It is found more convenient when most of the items of an account exceed $100 (unless they are even hundreds) to use only the TENTH part of each bill. Thus,

January	8th,	bill goods,	$478	called	$48
"	20th,	" "	362	"	36
April	15th,	" "	79	"	8
		Total,			92
Now turn to January 8th, and opposite $48 you find					336
" "	20th,	" "	36 "	"	684
" April	15th,	" "	8 "	"	832

Add them and divide by the sum of the tenths, ...92) 1852 ($20\frac{12}{92}$

On Table of Quotients No. 1, opposite 20, you find January 21st; now try the same by using the whole amounts, and the result will be the same into a small fraction of a day. In some cases it might make a difference of one or two days in a long account, a difference hardly worth mentioning. Those persons who wish to be *perfectly exact,* can use the *whole* amounts, the manner of doing which will be to find the hundreds at the bottom of the pages, and afterwards the odd numbers. I need hardly add that if the above plan of using the tenths be adopted, you must use the tenths only of all the bills in the account, however small they may be, and also to divide by the *sum of the tenths,* instead of the *amount of the account.*

RULES AND EXAMPLES.

WHERE ALL THE BILLS ARE SOLD ON AN EQUAL TERM OF CREDIT, AND THE ACCOUNT IS EMBRACED WITHIN A GIVEN YEAR.

RULE.—Turn to the different dates of the bills (found at the tops of the figure columns) and set down the figures found opposite the respective amounts; add them and divide by the whole debt. Then on Table of Quotients No. 1, opposite the number found by dividing as above, you have the average date. If the goods are sold on 4 months time, the account will be due 4 months after the date found, or if on 6 months time it will be due 6 months after the date found.

EXAMPLE.

	Date.		*Amount.*		*Amounts found under respective dates.*
1852,	January 4th, bill goods, 6 mo.,	$78 00	at page 13	234	
	" 9th, " "	22 00	" 12	176	
	March 18th, " "	99 00	" 27	7524	
	April 8th, " "	18 00	" 30	1746	
	Sept. 29th, " "	50 00	" 64	13550	
		$267 00		267) 23230 (87$\frac{1}{267}$ Ans.	

On Table of Quotients No. 1, you find opposite the number 87 March 29th, which is the *average date.* The whole account is therefore due 6 months from March 29th.

The above example is an account where all the bills were bought within a given year. Now suppose the last bill ($50) was bought September 29, 1853, instead of 1852; you would then proceed exactly as before, finding the same amounts as above, footing up - - - - - 23230

Then in addition to the amounts found under the respective dates, set down the figures found opposite $50 in the column marked 2d year, on the extreme right of any page, - - - - - - - - - - 18250

Add them and divide as before, - - - - - - - - - 267) 41480 (155$\frac{95}{267}$

Answer 155, which on Table of Quotients No. 1, is shown to be June 5th.

HENCE: WHERE ALL THE BILLS ARE SOLD ON AN *equal* TERM OF CREDIT, AND THE ACCOUNT EMBRACES PARTS OF TWO OR MORE YEARS.

RULE. — Proceed as in the previous case, setting down the amounts found under the respective dates of the bills, and also the amount found in the column of figures marked 2d year, opposite the total amount of the bills purchased in the 2d year of the account; add them and divide as before by the whole debt. Then on Table of Quotients No. 1, opposite the number found by dividing as above, you have the average date.

EXAMPLE.

	Date.		*Amounts found under repective dates.*
1852,	September 10th, bill of goods, 6 months,	$50 00	12600
	December 24th, " " "	25 00	8925
1853,	January 27th, " " "	25 00	650
	April 3d, " " "	50 00	4600
		$150 00	26775

Now the two bills bought in 1853, amount to $75, and opposite $75 in the column marked 2d year, you find, - - - - - 27375

Add them and divide by the whole debt, - - - - 150) 54150 (361 Ans.

Answer 361, and on Table of Quotients No. 1, opposite the number 361, you find December 28th, which is the average date. Therefore the account is due 6 months after December 28th, 1852.

Where an account is made up of several items, the majority of which are in the 2d year of the account, instead of working the equation as above, an easier method would be the following:

Proceed as in all former examples, setting down the amounts found under the respective dates; add them and then *subtract* the amount found in the column marked 2d year, opposite the total amount of the bills of the first year, and divide as before.

EXAMPLE.

Date.			*Amounts found under respective dates.*
October 7th, 1852,	bill of goods, 6 months,	$40 00	11160
Jan'y. 4th, 1853,	" " "	60 00	180
March 20th,	" " " "	90 00	7020
April 2d,	" " " "	20 00	1820
June 16th,	" " " "	9 00	1494
		$219 00	21674

Now the bill purchased in the first year of the account, is $40, and opposite $40 in the column marked 2d year, you find, - - - 14600*

Subtract this amount from the other, and divide by the whole debt, 219) 7074 ($32\frac{66}{219}$

Answer 32, and opposite 32 in Table of Quotients No. 1, you find February 2d, which is February 2d of 1853. The result would have been the same had the previous method been employed, as will be shown:

Amounts found under respective dates as above, - - 21674
Add amount found in column marked 2d year, opposite the amount of bills purchased in 1853, viz.: $179, - - 65335

Divide as before by amount of account, - - - 219) 87009 ($397\frac{66}{219}$

On Table of Quotients No. 1, opposite 397 you find February 2d, as before.

WHEN THE ACCOUNT TO BE AVERAGED IS MADE UP OF BILLS SOLD ON *unequal* TERMS OF CREDIT.

RULE. — Find the dates at which each bill becomes due and proceed as in the previous examples. The answer will be the average due of the account.

EXAMPLE.

Date.			*When due.*	*Amounts.*
March 20th,	bill of goods at 6 months,	$40 00	due Sept. 20	10480
" 25th,	" " 4 "	80 00	" July 25	16400
April 24th,	" " 6 "	30 00	" Oct. 24	8880
June 17th,	" " 3 "	50 00	" Sept. 17	12950
		$200 00		200) 48710 ($243\frac{110}{200}$

Answer called 244, as the fraction is more than one half. Opposite 244 on Table of Quotients No. 1, is September 2d, which is the *average due* of the above account.

Should there be only one or two bills purchased on a different term of credit from the rest, an easier method would be as follows:

Take the term of credit on which the majority of the bills were sold, as the basis, then throw forward all bills bought on a longer term of credit as much later as the difference in the time, and date back the bills bought on a shorter credit as much earlier as the difference in the time; proceed as in all former examples. The account will average due as many months forward of the time found as there was credit on the bills taken as a basis.

* Should this amount be greater than the amount found for the 2d year, subtract the lesser from the greater, and divide as before; but find the answer in Table of Quotients No. 2, as the account averages in the 1st year.

EXAMPLE.

	January	10,	bill of goods,	at 4	months,	$67 00
March	"	15,	"	" 6	"	33 00
	March	20,	"	" 4	"	25 00
	"	28,	"	" 4	"	17 00
	April	20,	"	" 4	"	90 00
May	June	17,	"	" 3	"	20 00

In the above example the majority of the bills were sold on a credit of 4 months. We therefore take 4 months as a basis. Now the bill of January 15th was sold at 6 months, therefore to make it equal a 4 months bill, we call it March 15th. The maturity of a bill bought January 15th at 6 months would be the same as if bought 2 months later at 4 months time. The bill of June 17th was sold on a credit of 3 months, and to make it equal a 4 months bill we date it back one month. The maturity of a bill bought June 17th, at 3 months, is the same as if bought May 17th, at 4 months. In averaging the above account, we therefore set down the amounts found under date of March 15th and May 17th, instead of January 15th, and June 17th. The whole account will then average due 4 months from the time found.

WHEN THERE ARE CASH BILLS OR ITEMS IN AN ACCOUNT.

Date the cash items as many months back of the real date as the term of credit upon which the goods were sold; proceed as in all former examples, and the answer will be the average date. The average due will be according to the terms of credit.

EXAMPLE.

Date.					*Amounts found under respective dates.*
January 6,	bill of goods,	6 months,	$50 00	- - -	250
March 20,	"	"	30 00	- - -	2340
June 7,	"	"	75 00	- - -	11775
Feb. 2, August 2,	cash paid freight, &c.,		10 00	- - -	320
			$165 00		165) 14685 (89

Answer 89, which on Table of Quotients No. 1, is found to be March 31st, which is the average date, and the whole account is due 6 months after that date.

You observe that I have set down the amount found under date of February 2d, instead of August 2d, for the cash item of that date. Dating it back 6 months, makes it equivalent to a 6 month's bill; and a bill bought February 2d, at 6 months, would be due August 2d.

COMPOUND EQUATION.

By Compound Equation is meant the process by which we ascertain at what time the *balance* of an account becomes due, when there is both debt and credit.

WHEN BOTH SIDES OF THE ACCOUNT AVERAGE DUE IN THE SAME YEAR.

RULE.—Turn to the date of the average of each side of the account, and set down the products found opposite the respective footing; subtract the lesser from the greater, and divide by the balance of the account. Look on Table of Quotients for the number found by dividing, and it will point to the average of the balance of the account.

☞ If the *largest* side of the account has the *largest* product, then the answer is to be found in Table of Quotients No. 1. But if the *smallest* side of the account has the *largest* product, then the answer is found in Table of Quotients No. 2 — the dates of which refer to the year previous to that in which the account is contained.

EXAMPLE.

I have an account on my Ledger, both the debt and credit side of which is composed of sundry items, averaging as follows:

Footing of Dr. side $400 00 averaging due January 15th,
Footing of Cr. side $200 00 averaging due January 10th,

Balance, $200 00

Now it is evident that as the $200 was paid 5 days before the $400 was due, the remaining $200 would not be due till 5 days after the 15th, viz: January 20th. Let us see whether our rule will carry us through.

Turn to January 15th, and opposite $400 you find - - - - 5600
Turn to January 10th, and opposite $200 you find - - - - 1800

Subtract lesser from greater, and divide by balance of act., 200) 3800 (19 Ans.

Answer 19, which on Table of Quotients No. 1, is shown to be the 20th of January, which is the date on which the balance of the account becomes due.

In the above example, the *largest* side of the account had also the *largest* product, and therefore we find the answer in Table of Quotients No. 1. I subjoin an example where the *smallest* side of the account has the *largest* product.

I have an account on my Ledger, which presents the following appearance:
Footing of Dr. side $400 averaging due January 10th, 1853,
Footing of Cr. side $200 averaging due February 10th 1853,

Balance, $200
Turn to January 10th, and opposite $400 you find - - - - 3600
Turn to February 10th, and opposite $200 you find - - - - 8000

Deduct lesser amount from greater leaves, - - - - - - - 4400
Divide as before by balance of account, - - - - - - - 200) 4400 (22

Now in this case the *smallest* side of the account has the *largest* product (viz. 8000) consequently in accordance with our rule we look for the No. 22 in Table of Quotients No. 2, and find opposite it December 10th, which is December 10th 1852. The *rationale* of the above is this: the $400 debt was due January 10th; one half of the debt was paid February 10th, or 31 days *after* it was due, consequently to equalize it, the other half of the account would be thrown back 31 days, or become due 31 days *earlier*, and 31 days back of January 10th, would be December 10th, as above found.

WHEN THE TWO SIDES OF THE ACCOUNT AVERAGE DUE IN DIFFERENT YEARS.

RULE.—Call the year in which the earliest date is found, the *first* year of the account, and proceed as in a simple equation, where the account is contained in two years; subtract the lesser product from the greater, and divide as before by the balance of the account. [Look on Table of Quotients No. 1, for the number found by dividing, and it will point to the average of the balance of the account.]

EXAMPLE.

I have an account upon my Ledger, averaging as follows:
Dr. side $400, averaging due December 15th, 1852,
Cr. side $200, averaging due January 15th, 1853.
We call 1852 the *first year* of the account, and proceed as follows:

Turn to December 15th, and opposite $400 find - - - -		139200
Turn to January 15th, and opposite $200 find - -	2800	
Add amount in column of 2d year, opposite $200	73000	75800

Subtract lesser from greater, and divide by the balance account 200) 63400 (317

Answer 317, which on table of Quotients No. 1, is shown to be November 14th, which is November of 1852, or *first year* of the account. Now reverse the above:

Dr. side $200, averaging due December 15th, 1852,
Cr. side $400, averaging due January 15th, 1853.
We call 1852 the *first year*, of the account, and proceed as before.

Turn to December 15th, and opposite $200 find - - - -		69600
Turn to January 15th, and opposite $400 find - -	5600	
Add amount in column of 2d year, opposite $400	146000	151600

Subtract lesser from greater, and divide by balance account, 200) 82000 (410

Answer 410, which on Table of Quotients No. 1, is shown to be February 15th, which is February 15th of 1853, or *second* year of the account.

TABLE OF QUOTIENTS.

NO 1.

This table shows the number of days from January 1st to any other date of the same year. In averaging an account whenever a Quotient Number is found which is less than 365, look for it in this table, and opposite the number you have the *average date*, which date is in the *first* year of the account averaged.

TABLE OF QUOTIENTS.

NO. 1 CONTINUED.

This Table is a continuation of Table No. 1, and shows the number of days from January 1st of *one year* to any date of the *next year*. In averaging an account whenever a Quotient Number is found which is greater than 365 look for it in this table, and opposite the number you have the *Average Date*, which date is in the *second* year of the account.

TABLE OF QUOTIENTS.

NO 2.

This Table shows the number of days from January 1st of any year, *counted backwards*, to any date of the *previous year*, and is to be used in a Compound Equation as directed. Whenever a date is found in this Table it refers to the *previous year* to the one in which the calculations are made.

Jan.	1st	2d	3d	4th	5th	6th	Jan.	7th	8th	9th	10th	2d Year.

There are no amounts under date of January 1st, for the reason that there is no prolongation of time from January 1st to January 1st of the same year. Therefore, in working an equation when the first bill is dated January 1st, no amount is to be set down in the *addition*, but in *dividing*, the whole amount of the account is to be used as a Divisor in all cases.

JANUARY.

TESTIMONIALS.

The following testimonials are selected from a number received since the first edition was issued:

ROCHESTER, N. Y., July 30, 1853.

I have examined "Martin's Equation Tables" for Averaging Accounts, and am much pleased with them. The simplicity of their arrangement and the vast amount of labor saved by their use, must commend them to the favorable notice of all.

Mr. Martin has been my book-keeper for more than six years past, and from having had ample experience in that particular department of my extensive business, and from his uniform correctness, I can unhesitatingly recommend his work to all who have occasion to average accounts, as being correct in principle and detail, and well calculated to save time and labor.

D. R. BARTON, Manufacturer of and Wholesale Dealer in Edge Tools.

[From the Rochester American.]

Mr. GEO. W. MARTIN, an accomplished and thorough practical accountant of this city, is the author of a work just published by Erastus Darrow, which immediately on its appearance, has excited a strong feeling of interest on the part of our business men.

The book performs, in a most commodious and luminous manner, all that its title indicates. It does the thinking and nearly all the figuring required to equate any series of payments. Nothing can possibly be more complete of its kind, or more satisfactory in its operation. Mr. MARTIN has really achieved a triumph.

[From the Daily Democrat.]

The accountant will perceive at once the value of this book, designed and calculated to save a great amount of labor and time. It is prepared with much care by a gentleman thoroughly and practically conversant with the matter, and its calculations are evidently correct and founded upon a simple process, the working of which is easily understood.

The Equation Tables prepared by you I have examined and tested with various computations and have invariably found them correct. They are what every book-keeper should have to assist him in calculating the average of bills, and no merchant should hesitate to purchase and keep by him. I consider them quite an acquisition to a *set of books*, and one of those things much sought after in these days of steam — '*A labor saving machine.*'

TOWNSEND FONDEY, with E. Corning & Co., Albany, N. Y.

"I feel truly an interest in the volume." "Its standing once obtained in the mercantile community, it is sure to maintain its footing." "It has given me entire satisfaction."

A. J. SYMONDS, Book-keeper for Pappenheimer & Dreyfoos,
Importers of Hardware and Cutlery, Cincinnati.

I am now using "Martin's Equation Tables," and from experience can recommend it to Accountants and business men generally as a most convenient and reliable work. It certainly is *indispensable* for despatching business in a shorter and more reliable way than any previous method, reflecting credit on its author, and judging from its merits it is destined to be universally adopted.

D. C. HICKS, Accountant with S. Swartz & Bro's, Buffalo.

The undersigned having used a work entitled "Martin's Equation Tables," for Averaging Accounts, prepared by Mr. Geo. W. Martin, of this city, take pleasure in bearing testimony to its *great practical utility*. We find it a great convenience and saving of time in equating accounts, and think it eminently deserves a place in every counting house.

A. S. MANN, Book-Keeper for Wilder, Gorton & Co., Wholesale Dealers in Dry Goods.
O. A HYDE & Co., Wholesale Dealers in Dry Goods.

HENRY L. SMITH.
H. E. ROCHESTER & Co., Dealers in Coal and Iron.
S. B. RAYMOND, Brewster's Insurance and Banking Office.

Mr. Geo. W. Martin:

Dear Sir:—I have used and examined your Equation Tables and have found them uniformly correct, being, as I think, the best work of the kind extant.

SAMUEL E. UNDERHILL,
Book-Keeper with Harris & Ladd.

Chicago, Aug. 6, 1853.

Chicago, Ill., July 21, 1853.

Mr. Geo. W. Martin:

Dear Sir—We think so favorably of your "Equation Tables," that we would upon no account be without them, and cheerfully annex our opinion of the work, which you are at liberty to use.

The undersigned, Merchants of Chicago, having used "Martin's Equation Tables," consider the work an *invaluable aid* to the equating of accounts, and one much needed in *every* counting house. We heartily recommend it to Manufacturers, Merchants and Accountants, as just the thing they have always wanted.

W. F. DOMINICK & CO.

We fully concur with the above.

WM. BLAIR & CO.

We have had a copy of your "Equation Tables" about three months, and so far as we have had occasion to use it, we find it correct, and also *a great saving of time.*

Chicago, July 26, 1853. WILLIAMS, AVERY & THOMPSON.

"They are the result of long experience and careful study, and seem to us admirably adapted to serve a very important purpose."—[*Buffalo Morning Express.*

This is to certify that having examined Martin's Equation Tables, I have found them to be perfectly correct, and consider them a great saving of time in averaging accounts.

THOS. W. REID, 40 Dey Street, New York.

NEW YORK, July 29, 1853.

We, the undersigned, have examined Martin's Equation Tables, and believe them to be correct and a great saving of time and labor.

J. CURZEN, Book-keeper for C. S. Benedict & Co., 52 Dey Street.
JOHN C. TUCKER & CO., 180 Greenwich Street.
ELDER & PAINTER, 75 Dey Street.
R. D. ARTHUR, 35 Dey Street.
J. A. LORD, Benedict & B. Manuf. Co., 48 Dey Street.
WHEELOCK & DANIELS, 3 Dey Street.
GILES P. HALL, Book-keeper for A. Woodward & Son, 3 Dey Street.
ALFRED W. HOFFMAN, Book-keeper for Bradford, Heath & Clark.
S. B. TAYLOR, Book-keeper for Halstead & Baldwin, 35 Dey Street.
S. M. GARDNER, Book-keeper for Bates, Taylor & Co.
S. A. COCHRANE & CO., 6 Dey Street.
TOWNSEND, CLARK & CO., 15 Dey Street.
J. E. WHEELER, " "
E. S. WHEELER & CO., " "
WM. FITCH, Book-keeper for Peet, Wackerman & Co., 4 Dey Street.

We, the undersigned, have examined "Martin's Equation Tables," and find them a great convenience in averaging accounts, shortening the process very much, and believing them correct, take pleasure in recommending them to Merchants and Book-Keepers generally, as deserving their patronage.
